

What is FinTrack?

FinTrack is an AI-powered personal finance platform that analyzes bank statements, auto-categorizes transactions, and generates visual spending reports. The source code is structured as a React 18 single-page application, ready to deploy on GitHub Pages, Vercel, or Netlify.

Project File Structure

File / Folder	Description
src/pages/	All 9 route-level pages (Login, Register, Upload, etc.)
src/components/	Sidebar navigation, TransactionCard UI
src/context/AuthContext.jsx	Global auth state (login / logout)
src/utils/api.js	Axios API helper — connect your backend here
public/index.html	App entry HTML
package.json	Dependencies: React, Recharts, Lucide, Axios
.env.example	Template for environment variables
.gitignore	Excludes node_modules, .env, build/
README.md	Full documentation for GitHub repo

Prerequisites

- Node.js version 16 or higher
- npm (comes with Node.js) or yarn
- A GitHub account
- Git installed on your machine

Step 1 — Extract & Install

Download and unzip **fintrack-github.zip**, then open a terminal in the extracted folder:

```
cd fintrack npm install
```

Test locally:

```
npm start
```

The app will open at **http://localhost:3000**

Step 2 — Create a GitHub Repository

- Go to github.com and sign in
- Click the green **New** button (top-left)

- Name your repo (e.g. **fintrack**)
- Choose Public or Private
- Click **Create repository** — do NOT initialize with README

Step 3 — Push Code to GitHub

Run these commands in your project folder:

```
git init
git add .
git commit -m "Initial commit - FinTrack app"
git branch -M main
git remote add origin https://github.com/YOUR_USERNAME/fintrack.git
git push -u origin main
```

Replace **YOUR_USERNAME** with your actual GitHub username.

Step 4 — Environment Variables

Copy **.env.example** to a new file called **.env** and fill in your values:

```
cp .env.example .env # Edit .env: REACT_APP_API_URL=https://your-backend-api.com
REACT_APP_ANTHROPIC_API_KEY=your_key_here
```

The **.env** file is already in **.gitignore** — it will never be pushed to GitHub.

Step 5 — Deploy (Optional)

Platform	Steps
Vercel (Recommended)	Connect GitHub repo at vercel.com → auto-deploys on every push
Netlify	Drag the /build folder to netlify.com/drop, or connect GitHub
GitHub Pages	npm run build then push /build to gh-pages branch

Pages Included

Route	Page	Access
/login	Login	Public
/register	Register	Public
/forgot-password	Forgot Password	Public
/reset-password	Reset Password	Public
/upload	Upload Bank Statement	Protected
/transactions	Transaction List + Filters	Protected
/reports	Charts & Spending Breakdown	Protected
/pricing	Pricing Plans (Free/Pro/Enterprise)	Public
/settings	Account Settings	Protected
